13.

$\langle \text{LIT}(3), x_{i_0}, \text{phi}, \text{rho}_0 \rangle \downarrow \langle 3, x_{i_0}, \text{phi}, \text{rho}_0 \rangle$ (LITERAL)
 $X \in \text{dom}(\text{rho})$

$\langle \text{SET}(\text{VAR}(X), \text{LIT}(3)), x_{i_0}, \text{phi}, \text{rho}_0 \rangle \downarrow \langle 3, x_{i_1}, \text{phi}, \text{rho}_1 \{X \rightarrow 3\} \rangle$ (FORMALASSIGN)
 $\langle \text{VAR}(X), x_{i_1}, \text{phi}, \text{rho}_1 \rangle \downarrow \langle 3, x_{i_1}, \text{phi}, \text{rho}_1 \rangle$ (FORMALVAR)

$\langle \text{BEGIN}(\text{SET}(\text{VAR}(X), \text{LIT}(3)), \text{VAR}(X)), x_{i_0}, \text{phi}, \text{rho}_0 \rangle \downarrow \langle 3, x_{i_1}, \text{phi}, \text{rho}_1 \rangle$ (BEGIN)

14.

$X \in \text{dom}(\text{rho})$
 $\text{rho}(X) = v_1 \neq 0$

$\langle \text{VAR}(X), x_{i_0}, \text{phi}, \text{rho}_0 \rangle \downarrow \langle v_1, x_{i_0}, \text{phi}, \text{rho}_0 \rangle$ (FORMALVAR)
 $\langle \text{VAR}(X), x_{i_0}, \text{phi}, \text{rho}_0 \rangle \downarrow \langle v_1, x_{i_0}, \text{phi}, \text{rho}_0 \rangle$ (FORMALVAR)

$\langle \text{IF}(\text{VAR}(X), \text{VAR}(X), \text{LIT}(0)), x_{i_0}, \text{phi}, \text{rho}_0 \rangle \downarrow \langle v_1, x_{i_0}, \text{phi}, \text{rho}_0 \rangle$ (IFTRUE)

$X \in \text{dom}(\text{rho})$
 $\text{rho}(X) = 0$

$\langle \text{VAR}(X), x_{i_0}, \text{phi}, \text{rho}_0 \rangle \downarrow \langle 0, x_{i_0}, \text{phi}, \text{rho}_0 \rangle$ (FORMALVAR)
 $\langle \text{LIT}(X), x_{i_0}, \text{phi}, \text{rho}_0 \rangle \downarrow \langle 0, x_{i_0}, \text{phi}, \text{rho}_0 \rangle$ (LITERAL)

$\langle \text{IF}(\text{VAR}(X), \text{VAR}(X), \text{LIT}(0)), x_{i_0}, \text{phi}, \text{rho}_0 \rangle \downarrow \langle 0, x_{i_0}, \text{phi}, \text{rho}_0 \rangle$ (IFFALSE)

$X \in \text{dom}(\text{rho})$
 $\text{rho}(X) = v_2$

$\langle \text{VAR}(X), x_{i_0}, \text{phi}, \text{rho}_0 \rangle \downarrow \langle v_2, x_{i_0}, \text{phi}, \text{rho}_0 \rangle$ (FORMALVAR)

When $\text{rho}(X) = 0$, $v_1 = v_2 = 0$, and when $\text{rho}(X) \neq 0$, $v_1 = v_2 = \text{rho}(X)$, so $v_1 = v_2$

21.

A.

$X \notin \text{dom}(\rho)$

$X \notin \text{dom}(\xi)$

$\langle \text{VAR}(X), \xi_0, \phi, \rho_0 \rangle \downarrow \langle 0, \xi_1 \{X \rightarrow 0\}, \phi, \rho_0 \rangle$ (IMPLICITASSIGN)

B.

$X \notin \text{dom}(\rho)$

$X \notin \text{dom}(\xi)$

$\langle \text{VAR}(X), \xi_0, \phi, \rho_0 \rangle \downarrow \langle 0, \xi_0, \phi, \rho_0 \{X \rightarrow 0\} \rangle$ (IMPLICITASSIGN)

C.

I prefer the change to give Impcore Icon-like semantics because if an unbound variable is referenced, its scope should only be the scope of the current process because it is unfair to assume the variable will still be wanted after the procedure terminates.

20.

An expression is deterministic if it evaluates to the same value every time it is evaluated in a given set of environments. In notation:

Given $\langle e, \xi_0, \phi, \rho_0 \rangle \downarrow \langle v_1, \xi_1, \phi, \rho_1 \rangle$ and $\langle e, \xi_0, \phi, \rho_0 \rangle \downarrow \langle v_2, \xi_2, \phi, \rho_2 \rangle$
 $v_1 = v_2, \xi_1 = \xi_2$, and $\rho_1 = \rho_2$

Induction hypothesis: An evaluation of an expression is deterministic if it evaluates to at most one value given the same starting machine state with premises that have deterministic derivations.

Base Cases:

LIT:

$D =$

 $\langle \text{LIT}(v), \xi_0, \phi, \rho_0 \rangle \downarrow \langle v, \xi_0, \phi, \rho_0 \rangle$ (LITERAL)

A literal expression evaluates to its equivalent value, which is the same value regardless of the context the literal is used in, so for any v , so $v = v_1 = v_2, \xi_0 = \xi_1 = \xi_2$, and $\rho_0 = \rho_1 = \rho_2$.

VAR:

$$\begin{array}{l}
 X \in \text{dom}(\text{rho}) \\
 \text{rho}(X) = v \\
 D = \frac{}{\langle \text{VAR}(X), \text{xi}_0, \text{phi}, \text{rho}_0 \rangle \downarrow \langle v, \text{xi}_0, \text{phi}, \text{rho}_0 \rangle} \quad (\text{FORMALVAR})
 \end{array}$$

Therefore, $v = v_1 = v_2$, $\text{xi}_0 = \text{xi}_1 = \text{xi}_2$, and $\text{rho}_0 = \text{rho}_1 = \text{rho}_2$, so evaluating a formal variable expression is deterministic.

$$\begin{array}{l}
 X \notin \text{dom}(\text{rho}) \\
 X \in \text{dom}(\text{xi}) \\
 \text{xi}(X) = v \\
 D = \frac{}{\langle \text{VAR}(X), \text{xi}_0, \text{phi}, \text{rho}_0 \rangle \downarrow \langle v, \text{xi}_0, \text{phi}, \text{rho}_0 \rangle} \quad (\text{GLOBALVAR})
 \end{array}$$

Therefore, $v = v_1 = v_2$, $\text{xi}_0 = \text{xi}_1 = \text{xi}_2$, and $\text{rho}_0 = \text{rho}_1 = \text{rho}_2$, so evaluating a global variable expression is deterministic.

Induction Cases:

SET:

$$\begin{array}{l}
 X \in \text{dom}(\text{rho}) \\
 D_1 \\
 D = \frac{}{\langle \text{SET}(X, e), \text{xi}_0, \text{phi}, \text{rho}_0 \rangle \downarrow \langle v, \text{xi}_{\text{set}}, \text{phi}, \text{rho}_{\text{set}}\{X \rightarrow v\} \rangle} \quad (\text{FORMALASSIGN})
 \end{array}$$

By induction hypothesis, if D_1 is a deterministic derivation, then $v = v_1 = v_2$, $\text{xi}_{\text{set}} = \text{xi}_1 = \text{xi}_2$, and $\text{rho}_{\text{set}}\{X \rightarrow v\} = \text{rho}_1 = \text{rho}_2$.

$$\begin{array}{l}
 X \notin \text{dom}(\text{rho}) \\
 X \in \text{dom}(\text{xi}) \\
 D_1 \\
 D = \frac{}{\langle \text{SET}(X, e), \text{xi}_0, \text{phi}, \text{rho}_0 \rangle \downarrow \langle v, \text{xi}_{\text{set}}, \text{phi}, \text{rho}_{\text{set}}\{X \rightarrow v\} \rangle} \quad (\text{GLOBALASSIGN})
 \end{array}$$

By induction hypothesis, if D_1 is a deterministic derivation, then $v = v_1 = v_2$, $\text{xi}_{\text{set}}\{X \rightarrow v\} = \text{xi}_1 = \text{xi}_2$, and $\text{rho}_{\text{set}} = \text{rho}_1 = \text{rho}_2$.

IF:

$$\begin{array}{l}
 D_1 \\
 v_1 \neq 0 \\
 D_2 \\
 D = \frac{}{\langle \text{IF}(e, e_t, e_f), xi_0, \text{phi}, \text{rho}_0 \rangle \downarrow \langle v_t, xi_t, \text{phi}, \text{rho}_t \rangle} \quad (\text{IFTRUE})
 \end{array}$$

By induction hypothesis, if D_1 and D_2 are deterministic derivations, then $v_t = v_1 = v_2$, $xi_t = xi_1 = xi_2$, and $\text{rho}_t = \text{rho}_1 = \text{rho}_2$.

$$\begin{array}{l}
 D_1 \\
 v_1 = 0 \\
 D_3 \\
 D = \frac{}{\langle \text{IF}(e, e_t, e_f), xi_0, \text{phi}, \text{rho}_0 \rangle \downarrow \langle v_f, xi_f, \text{phi}, \text{rho}_f \rangle} \quad (\text{IFFALSE})
 \end{array}$$

By induction hypothesis, if D_1 and D_3 are deterministic derivations, then $v_f = v_1 = v_2$, $xi_f = xi_1 = xi_2$, and $\text{rho}_f = \text{rho}_1 = \text{rho}_2$.

APPLYADD:

$$\begin{array}{l}
 D_1 \\
 D_2 \\
 -2^{31} \leq v_a + v_b < 2^{31} \\
 D = \frac{}{\langle \text{APPLY}(+, e_a, e_b), xi_0, \text{phi}, \text{rho}_0 \rangle \downarrow \langle v_a + v_b, xi_{\text{add}}, \text{phi}, \text{rho}_{\text{add}} \rangle}
 \end{array}$$

By induction hypothesis, if D_1 and D_2 are deterministic derivations, then $v_a + v_b = v_1 = v_2$, $xi_{\text{add}} = xi_1 = xi_2$, and $\text{rho}_{\text{add}} = \text{rho}_1 = \text{rho}_2$.
